OpsGate - User & Admin Guide V2

Administrators · Security champions · Trainers

DailyOps.Tech · OpsGate · EN

Version: 2.1 (product 1.2 + V2 batch July 2026)

Language: English

Audience: console admins, security champions, trainers

1. Introduction

OpsGate protects company data when staff use AI websites in the browser.

This guide covers the console, extension, optional proxy, and SSO options.

For executives (CIO/CISO): see DECIDEURS-V2-EN.md.

For QA steps: GUIDE-TEST-V2.md.

2. Roles

Role	Can
Principal admin	Everything (admins, policy, licenses, recovery)
Console admin	Per permissions (events, agents, policy...)
End user	Extension banner mask/block, local journal

3. First console sign-in

1. Open the console URL (e.g. `http://127.0.0.1:5173`).
2. Check API OK.
3. Sign in with SSO, email/password (demo may be `admin@demo.local / 0000`), or passkey / Windows Hello.
4. If SSO enforce is on, only the SSO button appears.
5. If TOTP MFA is enabled, enter the Authenticator code.
6. Session already open: accept/refuse within 10 s, or read-only sign-in.
7. Multi-org: pick organization; later switches require MFA (MSP portfolio).

Change default passwords immediately in production.

4. Dashboards & navigation

- Dashboard: free widgets (drag/resize), licenses, connectivity, activity, requests.
- MSP portfolio (multi-org): cross-tenant KPIs, open with MFA.
- Messages: user -> admin inbox (reply, close, client ack).
- Events: filter by decision / severity / source.
- Agents: groups, profiles, maintenance, export + CSV import.
- Policy: default action, AI hosts, department profiles.
- People: users & groups (including LDAP).
- Moving rules: AND/OR conditions, permanent option.
- Audit: WORM journal + integrity check (principal).
- Settings: monitoring, SIEM, SMTP, multi-channel notifications, LDAP, reports, backup.

Deep links: `#/dashboard`, `#/settings/mail`, `#/messages`, etc.
Force sync pushes policy to agents on the next poll (~2 minutes).

5. Browser extension

Install

Browser	Build	Load
Chrome / Edge	<code>pnpm build:chrome</code>	<code>build/chrome-mv3-prod</code>
Firefox	<code>pnpm build:firefox</code>	<code>about:debugging -> manifest</code>
Safari	<code>pnpm build:safari</code>	Xcode converter (Mac)

Daily use

1. Open an allow-listed AI site.
2. Paste a test secret into the prompt.
3. The OpsGate banner offers mask & send, send anyway (if policy allows), or cancel.
4. Attach a file: scan PDF / DOCX / PPTX / XLSX; image OCR if policy enables it.
5. Contact admin from the extension (messages).
6. Local journal in the popup; org events when enrolled.

Org enrollment

Options -> org code (e.g. DEMO-OPSGATE) -> enroll.
Policy and rule pack sync automatically.

6. Local proxy (optional)

Complements the extension (HTTPS multi-AI safety net).

```
pnpm proxy:gen-ca
# Trust CA
pnpm proxy:enroll
pnpm proxy:dev
```

Modes: observe (log only) / enforce (block or on-wire soft-mask).
Windows production: `pnpm proxy:msi` (portable Node included).

7. SSO, MFA, passkeys, SAML

Method	Where
OIDC	SSO button; <code>OPSGATE_OIDC_*</code>
SAML	<code>/v1/auth/saml/start</code> ; <code>OPSGATE_SAML_*</code> (IdP signature in prod)
TOTP MFA	Settings -> General (QR); required for multi-org

WebAuthn / passkeys	Settings -> General + login button
LDAP	Settings -> LDAP -> Test / Sync / Cron

8. Exports, alerts, backup

Feature	Where
Scheduled log export (email)	Settings -> Reports + SMTP
Test export send	Send a test export now
License / lockout / recovery alerts	Settings -> Notifications (+ Telegram/Slack)
Org config backup	Settings -> General -> Export / Import
Postgres backup	scripts/backup-db.ps1 (see architecture/BACKUP.md)

9. Licenses (customer side)

- 30-day trial from organization creation.
- Full license: paste the key provided by DailyOps (OPS-XXXX-...) under Settings -> License management -> Add.
- Company / seats / expiry fields are filled by the key (read-only).
- You do not issue licenses from the console - issuance is vendor-only (see LICENCES-CLIENTS.md for DailyOps ops).

10. Admin best practices

1. Durable Postgres (DATABASE_URL) for real pilots.
2. Force-install the extension (MDM / AMO) + policy lock.
3. SSO + MFA (and passkeys) for admins; multi-tenant MFA.
4. Real SMTP for password reset / OTP / exports.
5. Connect SIEM for the SOC.
6. Daily DB backup + config export before upgrades.
7. Monthly intentional secret test (control effectiveness).
8. Never commit IdP / LDAP / SMTP / Stripe secrets.

11. Support

- Technical trail: CHANGELOG-TECHNIQUE.md, architecture/*
- Privacy: PRIVACY.md
- Proxy runbook: architecture/PROXY-RUNBOOK.md
- Licenses (vendor vs customer): LICENCES-CLIENTS.md
